

Editorial: Nature's Day in Court. Rights of Nature and Access to Justice in Ecuador and Germany

By *Andreas Fischer-Lescano** and *Andreas Gutmann***

Apart from the corona crisis, climate and the environment are probably among the most debated topics in the legal discourse these days. Although neither serious environmental degradation nor civil society protests against it represent new phenomena, the topic has become the focus of public attention – not least due to high-profile civil society actors such as Fridays for Future.

In jurisprudence, the growing importance of environmental protection is reflected in the large number of lawsuits filed by civil society demanding better environmental protection. So-called climate lawsuits increasingly gain popularity in various places around the world. The famous Dutch Urgenda-case¹ is just one of many rulings that call governments for greater environmental protection.² Nevertheless, the number of cases in which courts reject climate action is likely to be even higher.³

Perhaps this outlook will change in the near future. In a landmark ruling earlier this year, the German Federal Constitutional Court obligated the state to take decisive action against climate change.⁴ The court based this on the civil liberties of future generations.

Scholars rightly criticized this decision for the fact that the court's extensive reasoning did not deal with legal instruments developed in the global South.⁵ The same lacuna can be found within jurisprudence. A recently published anthology on climate litigation sheds light on legal developments in nine countries, only one of them – Brazil – is located in the global South.⁶ This Western-oriented view is not only problematic because it excludes subaltern voices and therefore reproduces colonial epistemological structures. It also ignores interesting legal developments. At the same time, innovative concepts could be found precisely in legal systems located in the global South. The Colombian Supreme Court provides an auspicious example.⁷ It accepted the petition of a group of young people who had sued the government for inadequate protection of the Amazon rain forest, which plays a crucial role in the global climate. The court based its decision not only on the petitioners' human rights, but also made clear that future generations and the Amazonian region itself have a right to environmental protection.

A. Rights of Nature: A paradigm shift

In 2021, the year Christopher D. Stone, a brilliant scholar and bold advocate for nature, passed away,⁸ his most famous idea of granting rights to nature⁹ seems more vital than ever. Especially in various legal systems of the global South,¹⁰ the emergence of Rights of Nature (RoN) has been observed in the recent past.¹¹ Some authors even describe a global trend in this direction.¹² The declaration of natural assets worthy of special protection as

legal subjects enables, for example, environmental protection associations to file appeals on their behalf and is intended to contribute to solving the pressing environmental problems of our time.¹³ The most decisive step towards RoN was taken in Ecuador, where the 2008 Constitution grants such rights to the whole of nature in Articles 10 (2), 71 (1) and 72.¹⁴

In Ecuador, "Nature or Pacha Mama" now has the constitutionally guaranteed right to have its existence and the maintenance of the reproduction of its life cycles respected (Art. 71(1)). In addition, it must be comprehensively restored¹⁵ in the event of damage (Art. 72). The use of the term Pacha Mama refers to indigenous thinking.¹⁶ Although the exact role that the indigenous movement played in the constituent process that led to the inclusion of RoN in the Constitution is disputed,¹⁷ it is clear that the Constitution calls for the recognition of indigenous thought.¹⁸

Although Ecuador is the only country to date that recognizes RoN in its Constitution, similar rights have been established in other countries¹⁹ through laws,²⁰ municipal acts,²¹ or court decisions.²²

B. Access to court as a touchstone

The issue of access to justice is one of the main concerns of the discussion on RoN. Stone's seminal article "Should Trees Have Standing"²³, which is still considered the most influential work on the subject,²⁴ bears this question in its title. Stone viewed RoN as a way to solve the problem of restrictions limiting legal actions against environmental damage. In Ecuador, the fact that, according to Art. 71 (2), 88 CRE, RoN can be claimed by any person in court, is one of its defining features. At the same time, the lack of access to justice remains an obstacle to environmental protection or animal welfare law in countries like Ger-

19 The website <http://www.harmonywithnatureun.org/rightsOfNature/> provides an overview over jurisdictions where RoN have been established or have been proposed (last accessed on 4 August 2021).

many.²⁵ Even in cases where the violation of environmental regulations is obvious, access to justice may be impossible.

This special issue addresses various aspects of access to justice for natural entities. The question of access to justice essentially determines whether and in what way social conflicts can be handled legally. This requires considerable translation effort on the part of the parties involved. The parties to the conflict must formulate their positions in such a way that they can be dealt with in court proceedings.²⁶

C. Unequal global setting

RoN arise in a global context that is not free of power relations. On the one hand, it is evident, especially since “climate justice” has become an important demand of the climate strike movement, that the causes and consequences of environmental disasters are extremely unequally distributed across the globe. They thus reproduce imbalances shaped by colonialism. In Ecuador in particular, most environmental conflicts are based on the extraction of raw materials for the world market,²⁷ such as oil or copper, which ultimately support above all the life and economic model of the global North and indirectly or directly fuel the climate crisis.

Such inequalities are also reflected in the law. The disregard of Southern legal developments by the German Federal Constitutional Court described at the beginning therefore seems symptomatic. The power of expression is unequally distributed in the global legal discourse, and it is much more difficult for non-Western law to be heard internationally.²⁸ However, this special issue aims to show that dialogue with legal systems of the global South can also significantly enrich Western law.

D. About the content of the special issue

Exclusion and inclusion is the central theme of the paper written by *Andreas Gutmann* and *Viviana Morales*. They argue that modern and liberal law, because of its focus on human beings, bring about a double exclusion. Thus, on the one hand, nature is largely absent from the law and only enters the legal process mediated by human rights. For this reason, the German Federal Constitutional Court had to take the detour via the civil rights of future generations in the judgement mentioned at the beginning. On the other hand, this exclusion of nature – according to *Gutmann* and *Morales* – at the same time excludes numerous non-Western worldviews and forms of knowledge to which a separation of humans and nature is alien. RoN challenge this exclusion. The authors emphasize that such rights are demanded by various social movements in different places around the world. These movements demand that nature has to be heard within the legal framework. The global movement for RoN thus negotiates the exclusions that anthropocentric law produces. These processes of negotiation continue even when, as in Ecuador, RoN are formally recognized by the legal system. RoN, the authors argue, are thus not a panacea, but they institutionalize the participation of previously excluded entities and worldviews.

The closely related contributions by *Maria José Narváez* and *Elena Ewering/Tore Vetter* deal with the effectiveness of RoN. Here, the authors undertake an innovative kind of legal comparison by asking the questions: What if RoN existed in Germany (*Narváez*)? And what if these rights did not exist in Ecuador (*Ewering/Vetter*)? Instead of the classic comparison consisting of two country reports and the elaboration of similarities and differences, a case from Germany is examined through the lens of Ecuadorian law and one from Ecuador through that of German law. The texts show which environmental procedural instruments exist in both countries and shed light on the ways in which RoN can open up access to justice in environmental matters.

This is done on the basis of politically controversial cases. *Narváez* considers a case on open-pit lignite mining in Germany's Hambach Forest, a project that has been the subject of both civil society protests and various legal remedies. While the German activists had to develop elaborate legal constructions to get their day in court, at least the issue of access to justice would have been easier to resolve under Ecuadorian law. Nevertheless, Ecuadorian RoN also pose a major challenge, as *Narváez* shows.

The text is written in Spanish. By publishing a Spanish-language text in the otherwise English-language special issue, we attempt a compromise between engaging in a global discourse and mapping linguistic diversity, as well as addressing the exclusionary effects of ever-expanding linguistic standardization.

The Ecuadorian case, to which *Ewering/Vetter* apply German law, involves the construction of a hydroelectric power plant that led to flooding, threatening not only various ecosystems but also human communities settled along the Dulcepamba River. The case is paradigmatic of the complexity and multipolarity of environmental conflicts; here, for

example, green energy interferes destructively with nature. RoN, *Ewering/Vetter* conclude, offer a way to hear the diversity of affected voices in such constellations.

E. On the background of this special issue

This special issue contains some of the first results of the group of researchers working together in the project "Nature as a Legal Person", funded by the German Research Fund (DFG).²⁹ The project is carried out in cooperation between the University of Bremen, Germany and the Instituto de Altos Estudios Nacionales (IAEN) in Quito, Ecuador. It examines how new legal personalities emerge and how the law deals with these innovations, using the example of RoN, which was introduced by the Ecuadorian Constitution of 2008.

Although RoN are enjoying growing interest – also in European literature³⁰ – there are still numerous open questions. In particular, there is clearly too little research on the extent to which Western legal systems can or even should learn from the Ecuadorian example. In part, this question is answered in the negative with reference to the indigenous background of Ecuadorian RoN;³¹ in part, an orientation to the Ecuadorian model is demanded somewhat hastily, without taking its specific background into account.³² The project aims to counter this with a thorough theoretical and dogmatic examination of Ecuadorian constitutional law. In the sense of postcolonial theories,³³ specific views are to be critically questioned and non-Western visions made visible. The diversity of legal traditions is to be recognized as valuable and mutually enrich the legal systems under consideration.³⁴ The aim is to learn from Ecuadorian law and thus to overcome the one-sidedness prevailing in

classical comparative law, which assumes a global development towards a "Western" legal model.³⁵

So, while much has been written about the (im)possibility of legal transplants, South-North transplants have barely featured. It is possible that RoN will change things. After all, such rights – also with reference to the Ecuadorian experience – are currently being demanded in numerous Western countries as well. The topic has become omnipresent.

Given the scale of the current environmental threats, it is not surprising that profound changes are also being sought in the field of law. Radical changes are needed to stop the rampant environmental destruction. The search for innovations beyond the boundaries of one's own legal system could therefore be promising.

Interestingly enough, a meeting between members of the German and Colombian constitutional courts took place in July 2021, only a few months after publication of the climate judgment. Topics included the Corona crisis and RoN.³⁶
