

Contemporary performance measurement systems in Central and Eastern Europe: a synthesis of the empirical literature^{*}

Adriana Rejc Buhovac, Maja Zaman Groff^{**}

The paper presents a synthesis of contemporary performance measurement systems (PMS) research in Central and Eastern Europe (CEE). The literature review is organized around four determinants of contemporary PMS: multidimensionality, strategic focus, cascading, and alignment between PMS and compensation. Discussion of findings and future research directions are suggested along these four determinants while taking into account different institutional, legislative, and cultural contexts of the CEE countries. The paper delivers tentative implications for management researchers and management accounting researchers to guide future thinking and research on PMS in CEE countries. Finally, relevance of research findings for managers is discussed.

In diesem Artikel wird die Synthese von empirischen Forschungen zu modernen Performance-Mess-Systemen (PMS) in Mittel- und Osteuropa dargestellt. Die Literaturanalyse orientiert sich an vier Determinanten von modernen PMS: Multidimensionalität, strategischer Fokus, Cascading (hierarchische Struktur von Performance Indikatoren), und Verbindung zwischen PMS und Strategie. Die Ergebnisse und zukünftigen Forschungsrichtungen werden unter Berücksichtigung von verschiedenen institutionellen, legislativen und kulturellen Kontexten diskutiert. Damit werden Wege für Managementforscher und Management-Accounting-Forscher im Bereich von Performance-Mess-Systemen in Mittel- und Osteuropa aufgezeigt. Nicht zuletzt enthält der Artikel auch relevante Forschungsergebnisse für Manager.

Key words: contemporary performance measurement systems, Central and Eastern Europe, empirical research, synthesis of research questions, gaps in research

Introduction

In recent years, we have been witnessing rapid growth of the empirical performance measurement literature based on increased concerns about the performance measurement systems' role in enhancing company profitability (see, for example, Banker et al. 2000; Lipe/Salterio 2000; Nørreklit 2000; 2003; Kaplan/Norton 2001; 2004; Said et al. 2003; Ittner et al. 2003b; Braam/Nijssen 2004; Davis/Albright 2004; Papalexandris et al. 2004; De Geuser et al. 2009; Liang/Hou 2006). For years, however, most contributions, both in terms of the contemporary frameworks developed as well as empirical research published, came from the United States (Garrison 1990; Lynch/Cross 1991; Fisher 1992; Kaplan/Norton 1996; Atkinson et al. 1997; Fawcett et al. 1997; Simons 1995; Epstein/Birchard 1999; Merchant/Bruns 1986), the United Kingdom (Keegan et al. 1989; Fitzgerald et al. 1991; Kennerley/Neely 2000; Neely et al. 2001; Tonge et al. 2000; Frigo 2002; Brignall 2002; Butler et al. 1997), and continental Western European countries (Epstein/Manzoni 1998; Bontis et al. 1999; Weber/Schäffer 2001; Ahn 2001; Gehrke/Horvath 2002; Speckbacher et al. 2003; Baraldi/Monolo 2004). Very little is known about research conducted in the Central European and, in particular, Eastern European countries (CEE countries) which are characterized by considerably different institutional, legislative, and cultural contexts. The first objective of this paper is to synthesize empirical literature on contemporary performance measurement systems in CEE countries to guide future research. With an overview of the extant empirical research findings and specific guidance on future research in this field, researchers could get a better understanding of the effectiveness of contemporary PMS in CEE countries.

The growth of privatization, deregulation, international businesses, global competition, and new information and production technology has had special implications for performance measurement in these economies (Jaruga/Ho 2002). In numerous examples, companies from CEE countries enthusiastically introduced contemporary performance measurement frameworks developed for organizational contexts of the Western culture but did not achieve expected results (for discussions on historical, institutional, and cultural differences, see for example, Clark 2000; Illes/Rees 2001; Otte 2003; Warner et al. 2005). In other cases, multinational companies were spreading their operations throughout the world and implementing standardized performance measurement and reward systems worldwide, including the CEE countries (Butler et al. 1997; Bontis et al. 1999; Weber/Schäffer 2001; Ahn 2001; Gehrke/Horvath 2002; Otte 2003; Bescos/Cauvin 2004). The second objective of the paper is to build on the research findings to provide guidance on effective PMS implementation to both, managers from non-CEE region considering starting activities in CEE countries, and CEE managers adopting contemporary PMS concepts originating from non-CEE countries.

From a historical and cultural perspective, the Central European countries comprise the Czech Republic, Hungary, Poland, Slovakia, and Slovenia (Warner et al. 2005). In the CEE group, we also include Albania, Bosnia and Herzegovina, Bulgaria, Croatia, Estonia, Latvia, Lithuania, Macedonia, Montenegro, Romania, and Serbia (OECD List of CEE Countries, 2010). To organize our review, we focus on four determinants of contemporary performance measurement systems that contribute to PMS effectiveness – multidimensionality, strategic focus, cascading, and alignment between PMS and compensation (Kaplan/Norton 1996; 2001; 2004; Keegan et al. 1989; Fitzgerald et al. 1991; Lynch/Cross 1991; Atkinson et al. 1997; Neely et al. 2001). The literature synthesis is based on empirical studies published in English in academic journals and well established research conferences or books in the field. More specifically, journals and conference proceedings in management accounting, performance measurement, and management have been reviewed. The cut-off year for contemporary research in selected countries has been set to 1990 which is marked by the German unification in October that year and the subsequent collapse of the communist regimes. Only studies published from 1990 onwards have been considered. The synthesis of the PMS literature excludes studies of the public sector performance measurement. In very few examples, however, the samples of studied companies include some state-owned enterprises.

In the next section, we provide background on contemporary PMS and their role in enhancing company performance. We discuss the four determinants of contemporary PMS to guide the subsequent literature synthesis (in section 3) and a discussion of future research directions in light of underlying different institutional, legislative, and cultural characteristics of CEE countries (in section 4). Section 5 provides implications for managers and section 6 concludes with the limitations of the study.

Determinants of contemporary performance measurement systems

Performance measurement is closely related to the management control concepts of the English-speaking world and the ‘controlling’ concepts in German-speaking areas. The underlying aim behind these concepts is to steer or influence the behaviour of members of an organization in such a way as to increase the likelihood of achieving goals (Flamholtz 1996). Anthony’s classic definition (Otley et al. 1995) of *management control* defines it as “the process by which managers assure that resources are obtained and used effectively and efficiently in the accomplishment of the organization’s objectives” (Anthony 1965). The term *management control systems* refers to the set of procedures and processes that managers and other organizational participants use in order to help ensure the achievement of their goals and the goals of their organizations

(Otley/Berry 1994). It encompasses formal control systems as well as informal personal and social controls.

Performance measurement systems (PMS), the focus of our research, on the other hand, are considered components of managerial accounting and management control systems (Horváth et al. 1999) with a special focus on setting the direction (facilitating strategy development), making (strategic) decisions, and achieving desired goals (Anthony/Govindarajan 1998; Simons 1990; 2000; Ittner/Larcker 1997). More specifically, PMS are formal, information-based routines and procedures managers use to maintain or alter patterns in organizational activities (Simons 1995). Contemporary PMS such as the Balanced Scorecard (Kaplan/Norton 1996; 2001; 2004) and several other performance measurement frameworks (Keegan et al. 1989; Fitzgerald et al. 1991; Lynch/Cross 1991; Atkinson et al. 1997; Neely et al. 2001) are typically characterized by four determinants: multidimensionality, strategic focus, cascading, and an alignment with the incentive system. These determinants of PMS have been highlighted in both the professional and research literature. While multidimensionality – often established through a combination of financial and non-financial performance measures – and strategic focus characterize the content of contemporary PMS, cascading and alignment with compensation reflect their implementation perspective. Companies adopting such systems would improve their corporate profitability (Kaplan/Norton 2001; 2004; Simons 2000).

Multidimensionality

Contemporary PMS encompass multiple financial and non-financial perspectives, objectives, and performance measures (Garrison 1990; Eccles 1991; Fisher 1992; Kaplan/Norton 1996; 2004; Merchant/Bruns 1986). In the past, as companies invested in programs and initiatives to build their capabilities, managers relied solely on financial accounting reports. Today, financial information must be expanded to incorporate the valuation of the company's intangible and intellectual assets, such as committed and entrepreneurial employees, innovative internal processes, and loyal customers (Simons 2000). Extensive evidence indicates that the use of financial (accounting) performance measures in complex, dynamic, and uncertain environments results in dysfunctional managerial attitudes and behaviours, and low performance, which suggests that they should be complemented by qualitative or subjective performance measurement (Hartmann 2005). With financial performance measures, managers will primarily monitor results or past performance, while non-financial indicators provide leading information of future performance and enable managers to monitor the strategic drivers of success. From the perspective of economic theory: importance will be placed on additional, non-financial measures as long as such measures provide information beyond that contained in financial measures (Feltham/Xie 1994). While some

specific non-financial performance measures, such as customer satisfaction and TQM, are positively associated with performance (e.g. Abernethy/Lillis 1995; Ittner/Larcker 1995; 1997; 1998; Chenhall 1997; Kaynak 2003; Said et al. 2003; Liang/Hou 2006), the prevailing argument is that managers need measurement diversity (i.e. multidimensionality of their PMS) to enhance decision-making (Davis/Albright 2004; Gersbach 1998; Ittner et al. 2003a; Kaplan/Norton 1996). Empirical evidence about the positive association between balanced performance measurement and increased financial performance is, however, still inconclusive: the results of studies are mixed and partial (i.e. Abernethy/Lillis 1995; Ittner/Larcker 1995, 1997; Chenhall 1997; Perera et al. 1997; Said et al. 2003; Ittner et al. 2003a), indicating that there are other determinants of effective PMS.

Strategic alignment

Companies with multidimensional PMS will place more importance on those performance measures that provide information directly relevant to their respective strategies and strategic success factors (Kaplan/Norton 1996; 2004). According to Simons (2000), an ideal PMS should consist of a linked series of multiple goals and measures that are both consistent and mutually reinforcing. This can be viewed as the instrumentation for a single strategy. Contemporary performance measurement is thus characterized by assigning equal importance to the purposes and objectives of an organization (outcomes) as well as the processes and other drivers of success such as R&D investments, HRM policy, employee commitment, IT literacy etc. (Lynch/Cross 1991; Kaplan/Norton 1996; Atkinson et al. 1997). Measures must reflect the strategies and capabilities of the organization and not just the financial results. The main function of performance measurement in a strategic context, as claimed by Letza (1996), is to provide the means of control to achieve the objectives required and to fulfil a company's mission/strategy statement (see also Fawcett et al. 1997). A number of studies attempted to examine how the diversified performance measures are linked to organizational strategy. Perera et al. (1997), for example, argue that a customer-focused strategy is comprised of dimensions that are not well captured in traditional financial accounting information, and therefore, non-financial information would be more relevant. Higher linkages are reported by BSC users between performance measures and critical success factors, than by non-BSC users (Frigo/Krumwiede 1999). Rejc Buhovac and Slapničar (2007) find that focused performance measurement that is also well aligned with the business strategy (and further supported by tight control mechanisms) improves a firm's profitability.

Cascading

As noted earlier, multidimensionality and strategic focus represent the two content-related determinants of contemporary PMS, while cascading is the process factor that is needed to achieve high PMS effectiveness. A sound PMS will cascade down the organization. It will be integrated with the overall business strategy and so ensure that all stakeholders are working together in the same direction (Latest Trends in Corporate Performance Measurement, 2002). A number of accounting and strategic management studies indicate that in many companies managers at lower hierarchical levels rely exclusively on financial control systems that place too much emphasis on budgets and short-term profits, potentially hiding strategic problems from management and causing business managers to adopt a short-term perspective in their decisions (Ittner/Larcker 1997). Strategic control systems, on the other hand, include the development of action plans and targets for achieving the chosen strategic objectives, but also the assignment of responsibilities and alignment of reward systems with strategic objectives to ensure that managers' actions are consistent with the strategic goals and to avoid over-emphasis on short-term financial results (Govindarajan/Gupta 1985; Goold/Quinn 1990; Govindarajan/Shank 1995; Chenhall 2005). As the purpose of performance measures includes aligning employees with the business strategy and mission (Kaplan/Norton 1996; Simons 2000), the company's overall PMS would ideally be broken down into sets of local measurements for lower-level units to cascade the company's strategic objectives into more manageable subsets.

Alignment with the incentive system

The need for aligned performance measurement and incentive systems has been intensely accentuated in the literature (Merchant 1989; Bruns 1992; Kohn 1993; Ittner/Larcker 1995; Symons/Jacobs 1995; Ittner et al. 1997; Datar et al. 2001; Ittner et al. 2003a). Even multidimensional, strategic, and cascaded PMS may fail in coordinating employee efforts and their decision-making if not linked to the incentive system (Simons 2000; Kaplan/Norton 2001). Through better alignment of performance measurement and incentive systems, corporate performance is improved because the goals of the managers and their subordinates are brought into line with corporate strategy and goals and this in turn should result in enhanced performance. Holmstrom and Milgrom's (1991) analytical model shows that management decisions are affected by performance measures included in their performance evaluation and compensation schemes. The 'linkage' between PMS and compensation focuses employee attention on the measures that are the most critical for the strategy, and it provides extrinsic motivation by rewarding employees when they succeed in reaching the company objectives (Kaplan/Norton 2001). In an earlier study, Govindarajan and Gupta (1985) examined the association between strategy and remuneration and concluded that perceived organizational performance was higher when reward

systems were matched with organizational strategies. Symons and Jacobs (1995) indicate that in companies pursuing quality strategy, TQM-based reward systems are associated with higher performance. A well-developed incentive scheme may represent a crucial link between PMS and organizational performance by guiding employee behaviour in the direction of strategy implementation and thus contributing to the goal congruence.

A synthesis of contemporary performance measurement systems literature in Central and Eastern Europe

The four determinants of contemporary PMS provide a solid basis for evaluating the empirical PMS literature in CEE. Accordingly, we synthesize the literature by evaluating research contribution related to the multidimensionality, strategic content, cascading, and the alignment of performance measurement and incentive systems. Such a synthesis of the literature should facilitate the understanding of the empirical PMS literature in CEE and provide a structured means for identifying future research needs and opportunities. Summaries of relevant research findings are provided at the end of each section. Each subsection is accompanied by a table classifying CEE studies by author, research method, companies (by country and numbers where available), focus of the study, and principal findings.

Multidimensionality

The most numerous studies of contemporary performance measurement systems in CEE countries are those focusing on their multidimensionality. One of the most common variables in this line of investigation is the *use of financial and non-financial performance measures* for decision-making, diagnostic, and interactive purposes (Vrdoljak Raguž/Jelenc 2010; Peljhan et al. 2009; Horváth et al. 2008; Päril 2006; Vitezić/Knez-Riedl 2005; Rejc/Slapničar 2004; Vitezić 2004; Rejc 2003). Most studies of SMEs find that there is a strong focus on financial performance measures (see for example, Peljhan et al. 2009; Päril 2006). Studies of large companies, on the other hand, reveal a relatively high level of knowledge and use of multidimensional PMS (Marc et al. 2010a; Peljhan et al. 2009; Horváth et al. 2008; Rejc/Slapničar 2004; Rejc 2003; Čadež 2002). To the contrary, Vitezić/Knez-Riedl (2005), Vitezić (2004), Vrdoljak Raguž and Jelenc (2010) investigating Croatian companies, and Llaci et al. (2002) investigating Albanian companies, find that regardless of the size of the company, PMS are dominated by financial and accounting information. Renko and Pecotich (2001), investigating three case studies, find that all case companies are familiar with the Balanced Scorecard concept but they did not implement it in its formal configuration.

A couple of studies examine *trends in performance measurement and management control* through longitudinal studies. For example, Zoltay Paprika et al. (2008) reported that through an 8-year period, companies managed to

narrow the “gap” between the perceived importance of various non-financial performance elements and the actual use of related measures of performance. Bodnár et al. (2007) found that the use of comprehensive and complex performance measurement systems was hindered by system implementation obstacles.

A couple of multidimensionality studies investigate the role of various *contingent factors of PMS*. Rejc (2004) found that PMS multidimensionality was contingent upon the power of unions, technology, and corporate strategies. Haldma and Lääts (2002) confirmed that changes in management accounting and performance measurement systems practices were associated with shifts in the business and accounting environment, with legal accounting environment, shortage of qualified accountants, technology, and organizational aspects. Vámosi (2000), using a case study, found the environment an important contingent factor of the development of accounting and reporting practice. Marc et al. (2010b) explored how contextual factors (company size, industry, or market position), business objectives, and knowledge about contemporary management tools influence the decision to implement the Balanced Scorecard or similar integrated PMS. Company size, industry, and management knowledge have been confirmed as contingencies. In a descriptive study of 145 Estonian companies, Zernand-Vilson and Terk (2009) find that size, ownership, and export orientation bear impact on the use of the Balanced Scorecard.

Other studies include investigation of *the role of accounting and financial departments in designing PMS* (Lascu et al. 2006; Szycha 2002). In a Polish survey study, Szycha (2002) finds that the primary aim of accounting is to provide information for the preparation of financial statements. In another Polish study, Lascu et al. (2006) confirm that finance, accounting, and production, continue to retain their dominant status from the days of socialist planning when production and costs, rather than consumers and their needs, were being focused on.

Yet another set of studies examines the specifics of *management control systems of foreign subsidiaries*. In an earlier study, Hočevár et al. (2001) reported on the importance of financial indicators (such as paid realization and contribution margin). A later study by Zaman (2004) found that the four BSC perspectives are adequately represented within PMS. Somewhat disregarded are the measures of social responsibility, such as »environmental compliance« and »relationship with the host country government«.

The empirical literature related to multidimensionality of PMS in CEE countries also extends beyond these topics to examine *the impact of multidimensional (balanced) PMS on financial performance*. Rejc Buhovac and Slapničar (2007) found that focused (rather than balanced) performance measurement, but well aligned with the business strategy and further supported by tight control mechanisms, may actually improve a firm's profitability.

Table 1: Multidimensionality Studies

Study	Method	Companies/ Subjects	Domain	Results
Marc et al. (2010a)	Longitudinal Survey (2003-2008)/ Descriptive Statistics	93 large Slovenian companies	Trends in performance measurement and management control	The use of integrated PMS has increased since 2003 (68 percent of companies use the Balanced Scorecard or some other contemporary PMS). The dominance of financial indicators of performance may be explained in the light of the current financial crisis.
Marc et al. (2010b)	Survey/ Logistic Regression Analysis	323 Slovenian companies	Contingent factors of PMS	Large companies and utilities companies operating in highly regulated industries are more likely to use integrated PMS. Also, knowledge about contemporary management tools increases the likelihood of using integrated PMS.
Vrdoljak Raguž/ Jelenc (2010)	Survey/ Descriptive Statistics	81 large Croatian companies	Use of financial and non-financial performance measures	Despite the fact that the sampled companies have ISO certificates and are implementing TQM, the managing directors rely primarily on traditional financial performance measures.
Peljhan et al. (2009)	Survey/ Descriptive Statistics	323 Slovenian companies	Use of financial and non-financial performance measures	Managers of micro and small enterprises perceive financial performance measures as more important than non-financial. Only large companies are using integrated performance measurement systems.
Zernand-Vilson/ Terk (2009)	Survey/ Descriptive Statistics	145 Estonian companies	Use of financial and non-financial performance measures	Large and foreign-owned companies tend to use the Balanced Scorecard more frequently, while export-oriented companies use it less frequently than domestic companies.
Horváth et al. (2008)	Survey/ Descriptive Statistics	106 large Czech, Estonian, and Hungarian companies	Use of financial and non-financial performance measures	Managers are increasingly balancing financial and non-financial indicators of performance as well as their diagnostic and interactive use.

Zoltay Paprika et al. (2008)	Longitudinal Survey (1996-1999-2004)/ Descriptive Statistics, ANOVA tests	1,204 executives of Hungarian companies	Use of financial and non-financial performance measures and management control methods	In 1996, performance measurement is characterized by the dominance of traditional accounting, financial, and cost-based methods and performance measures. In 2004, the study reports a narrowing of the "gap" between the perceived importance of various non-financial performance elements and the actual use of related measures of performance. Hungarian managers, however, are still not fully exploiting the opportunities provided by their management information systems.
Bodnár et al. (2007)	Longitudinal Survey (1996-2004)/ Descriptive Statistics, Cluster Analysis	1,300 Hungarian companies (throughout all three years, 36 companies overlapping)	Trends in performance measurement and management control	The use of comprehensive and complex performance measurement systems is hindered by system implementation obstacles. Management reports are still heavily based on financial and accounting information.
Rejc Buhovac/ Slapničar (2007)	Case Study Interviews & Survey/ Descriptive Analysis, Graphical Analysis	8 Slovenian companies (119 survey participants and 48 interviewees)	The impact of balanced PMS on financial performance	The qualitative study finds that focused (rather than balanced) performance measurement that is also well aligned with the business strategy and further supported by tight control mechanisms may actually improve a firm's profitability.
Lascau et al. (2006)	Survey/ Independent Samples T-Test, χ^2 -test	105 Polish marketing managers and 98 U.S. marketing managers	The role of accounting and financial departments	Accounting and finance departments continue to retain their dominant status in preparing sales plans. Interdepartmental connectedness in Polish companies is low.
Päril (2006)	Survey/ Descriptive Statistics	72 small and medium-sized Estonian companies	Use of financial and non-financial performance measures	Strong profit orientation. Estonian managers consider it very important to monitor financial accounting indicators. Among non-financial indicators of performance, those reflecting internal processes are more often used than those reflecting processes related to customers, suppliers, and the market.

Vitezić/ Knez-Riedl (2005)	Survey/ Descriptive Statistics	A sample of large Croatian companies	Use of financial and non-financial performance measures	Companies are predominantly focused on periodical and annual reporting based on financial statements.
Rejc (2004)	Survey/ Independent Samples T-Test, Analysis of Variance	150 large Slovenian companies	Contingent factors of PMS	PMS multidimensionality is contingent upon the power of unions (performance measures of employee satisfaction), technology (performance measures of environmental impacts and corporate reputation), and the corporate strategies (non-financial performance measures associated with the achievement of growth objectives).
Rejc/ Slapničar (2004)	Survey/ Cluster Analysis, MANOVA, Univariate ANOVA, Discriminant Analysis, χ^2 -test	94 large Slovenian companies	Use of financial and non-financial performance measures	Employee relations, quality and innovation, as well as social and environmental responsibility are among the most critical aspects of corporate performance.
Vitezić (2004)	Survey/ Descriptive Statistics	A sample of large Croatian companies (size n.a.)	Use of financial and non-financial performance measures	Even in large companies with specific performance measurement departments, the focus is primarily on periodical and annual reporting based on financial statements.
Zaman (2004)	Survey/ Paired Samples T-Test	93 medium and large Slovenian companies	Management control of foreign subsidiaries	Financial aspect, customer aspect, internal business aspect, and learning aspect are adequately represented within PMS. Somewhat disregarded are the measures of social responsibility, such as »environmental compliance« and »relationship with the host country government«.
Rejc (2003)	Survey/ Independent Samples T-Test, Analysis of Variance	150 large Slovenian companies	Use of financial and non-financial performance measures	Customer satisfaction, product quality, employee satisfaction, and environmental performance are among those non-financial dimensions that rank highest; however, they are preceded by the financial perspective.
Čadež (2002)	Survey/ Independent Samples T-Test, Regression Analysis	70 large Slovenian companies	Strategic management accounting	Less than half of surveyed companies use multiple indicators to evaluate performance. No support was found that provision of strategic accounting information results in better performance.

Haldma/ Lääts (2002)	Survey, Interviews/ One-way Analysis, Two-way Analysis, Fisher's Exact Test	62 large Estonian manufacturing companies	Contingent factors of PMS	Changes in management accounting and performance measurement systems practices are associated with shifts in the business and accounting environment, with legal accounting environment, shortage of qualified accountants, technology, and organizational aspects.
Ilaci et al. (2002)	Survey/ Descriptive Statistics	160 Albanian companies	Use of financial and non-financial performance measures	Performance measurement systems are focused primarily on financial performance measures.
Szychta (2002)	Survey, Interviews, Archival/ Descriptive Statistics	60 Polish companies	Application of management accounting concepts and methods	The primary role of accounting departments is to provide information for financial statements in accordance with the accounting regulation, and for tax purposes. In only half of the surveyed companies, accounting provides information for lower-level managers in their decision-making or for control and performance measurement purposes.
Vámosi (2000)	Case Study Interviews/ Descriptive Analysis	1 Hungarian company	Contingent factors of PMS	The change from formal, hierarchical decisions to adaptation to a new market reality in the company's management accounting and reporting practice has been slow and synchronized with the changes in the environment.
Hočvar et al. (2001)	Survey/ Independent Samples T-Test, Regression Analysis	119 Slovenian companies	Management control of foreign subsidiaries	Paid realization is the most important performance measure, which suggests high awareness of financial discipline-related risks. The importance of contribution margin (second most important indicator) increases with increased sales in these markets. While this can have positive effects because increasing contribution margin results in higher profits, it can also be dangerous for the long-term success if the company satisfies itself with covering variable costs only.
Renko/ Pecotich (2001)	Case Study Interviews/ Descriptive Analysis	3 Croatian banks	Familiarity with contemporary PM frameworks	Managers are familiar with contemporary performance measurement systems, specifically the Balanced Scorecard, but have not yet started a formal implementation.

A reflective review of the findings of CEE multidimensionality studies (see Table 1) reveals the following common denominators. *First*, analysis of studies by year reveals apparent trends from predominant reliance on financial measures toward the usage of more balanced PMS (Hočevar et al. 2001; Llaci et al. 2002; Čadež 2002; Haldma/Lääts 2002; Szycha 2002; Rejc 2003; Horváth et al. 2008; Zoltay Paprika et al. 2008; Marc et al. 2010a).

Second, more recent studies reveal that large companies are more likely to use integrated PMS (Marc et al. 2010b; Peljhan et al. 2009) than small companies (Pärl 2006). Both findings are related to the lack of the management accounting knowledge at the management level, reported by Čadež (2002) and Pärl (2006). Čadež (2002) reported that although management information system provided relevant information for decision-making, managers exploited the information insufficiently because of the lack of accounting knowledge to interpret the provided information. Pärl (2006) reports that managers consider it extremely important to monitor financial accounting information. They regard financial indicators as clear and easy to understand, which reflects the need for management accounting related training to enable managers to recognize alternative (non-financial) indicators. The trend towards more integrated PMS suggests that knowledge problems are being exceeded.

Third, some conclusions regarding the multidimensionality of PMS cannot be generalized across all CEE countries. For example, employee power is a contingency factor, influencing development of performance measurement systems in those transitional countries which have experienced the self-management regime. In countries with strong trade unions, performance measurement systems are more focused on employee interests and performance measures such as employee satisfaction are more emphasized than in other countries (Rejc 2003; 2004; Rejc/Slapničar 2004).

Strategic alignment

A number of studies highlight the strategic alignment of PMS. Some studies investigate *the level and nature of strategic performance measurement* (Bratnicki et al. 2009; Peljhan et al. 2009; Král et al. 2007; Alas/Zernand 2002; Slávik 2001). Alas and Zernand (2002) found that SMEs rarely implemented integrated, strategic PMS. Král et al. (2007) found that the intensity of use of strategic management tools in Czech companies was significantly lower compared to the tactical and operational management tools. Slávik (2001) reports similar findings in an earlier study on Slovak companies.

Another group of researchers specifically investigated *the impact of strategic goals on the design of PMS*. Wagner et al. (2007) reported inconclusive findings. PMS typically emphasized financial and customer perspectives, while other perspectives were not fully integrated in PMS. Pučko and Čater (2008), on the other hand, investigated *the impact of PMS on strategy effectiveness*. The

Balanced Scorecard was found to be less relevant for effective strategy implementation. Less than 20 percent of surveyed companies used the BSC for strategy implementation purposes.

In a single study, researchers examined the *management accountant participation in strategic performance measurement*. Aver and Čadež (2009) reported that Slovenian management accountants were relatively strongly involved in the strategic management process, although the level of participation varied intensely across industries.

A couple of empirical studies moved beyond investigating whether there is a strategic alignment to determine *the impact of strategic PMS (also called strategic management accounting) on company performance*. In an earlier study, Čadež (2002) found that the provision of strategic accounting information did not result in better performance because management did not incorporate this information in the decision-making process. According to the survey, insufficient exploitation of provided accounting information for decision-making was related to the lack of accounting knowledge to interpret the provided information. Later, Čadež and Guilding (2008) confirmed the positive effect of strategic choices, market orientation, and company size on two distinct dimensions of strategic management accounting (accountant participation in strategic decision-making process and strategic management's usage of accounting) and, in turn, the mediating effect of strategic management accounting on company performance. Using a qualitative study, Rejc Buhovac and Slapničar (2007) found that despite the relatively consistent alignment of performance indicators with the corporate and business strategy, poor cascading and a lack of alignment to incentive systems prevented companies from increasing their financial performance.

Table 2: Strategic Alignment Studies

Study	Method	Companies/ Subjects	Domain	Results
Aver/ Čadež (2009)	Survey/ Correlation Coefficients, F-test	193 large Slovenian companies	Management accountant participation in strategic performance measurement	Slovenian management accountants are relatively strongly involved in strategic management processes, although the level of participation varies intensely across industries. Participation is relatively high in contemporary manufacturing industries, the trade sector, and tourism and hospitality services.
Bratnicki et al. (2009)	Survey within a Case Study/ Factor Analysis, Regression Analysis	83 branch managers of a Polish bank	Strategic management control	Strategic planning control stimulates organizational entrepreneurship, innovativeness, and risk-taking. Branch managers place strategic control between the tight financial and flexible strategic control.
Peļhjan et al. (2009)	Survey/ Descriptive Statistics	323 Slovenian companies	Strategic performance measurement	Large Slovenian companies consider "successful performance" mostly in terms of implementing the strategy, followed by pursuing the goals of the owners and achieving the goals of different stakeholders.
Čadež/ Guiding (2008)	Survey/ Structural Equation Modelling	193 large Slovenian companies	The impact of strategic management accounting on company performance	The study confirms the positive effect of strategic choices, market orientation, and company size on two distinct dimensions of strategic management accounting (SMA) and, in turn, the mediating effect of strategic management accounting on company performance.
Pučko/ Čater (2008)	Survey/ Descriptive Analysis	172 Slovenian companies	The impact of PMS on effective strategy implementation	The Balanced Scorecard has been found to be less relevant for effective strategy implementation. Only 19.2 percent of surveyed companies use the BSC for strategy implementation purposes.

Král et al. (2007)	Survey/ Descriptive Statistics, Pearson's Correlation Coefficient	44 large non- financial Czech companies	Strategic performance measurement	The intensity of use of strategic management tools is significantly lower compared to the tactical and operational management tools. A weak correlation was found between the declared goal of 'customer satisfaction' and the actual use of performance indicators focused on production quality and customer satisfaction.
Rejc Buhovac/ Slapničar (2007)	Case Study Interviews & Survey/ Descriptive Analysis, Graphical Analysis	8 Slovenian companies (119 survey participants and 48 interviewees)	The impact of strategic PMS on financial performance	In companies with comprehensive and balanced performance measurement, poor cascading and a lack of alignment to incentive systems appear to be the most critical factors preventing the companies from increasing their financial performance – despite the relatively consistent alignment of performance indicators with the corporate and business strategy.
Wagner et al. (2007)	Survey/ Descriptive Statistics, Pearson's Correlation Coefficient	44 large non- financial Czech companies	The impact of strategic goals on PMS	Inconclusive findings underline that performance measurement systems typically emphasize financial and customer perspectives, while other perspectives are not fully integrated in PMS.
Alas/ Zernand (2002)	Survey/ Descriptive Statistics	A sample of small and medium-sized Estonian com- panies (size n.a.)	Strategic performance measurement	SMEs rarely implement integrated, strategic performance measurement systems.
Čadež (2002)	Survey/ Independent Samples T-Test, Regression Analysis	70 large Slovenian companies	The impact of strategic accounting information on company performance	The provision of strategic accounting information does not result in better performance. Relevant information cannot translate into better performance if management does not incorporate this information in the decision-making process.
Slávik (2001)	Survey/ Descriptive Statistics	306 Slovak companies	Strategic performance measurement	Financial goals were revealed as very important, followed by production quality and market share. Strategy communication and implementation is often supported by an incomplete set of performance indicators and thus by poor performance measurement. The level of strategic performance measurement in Slovakia is generally low.

From the analysis of findings, resulting from the existing strategic alignment studies (Table 2) in the CEE, two principal conclusions can be drawn. *First*, strategy implementation purposes are not fully integrated in corporate PMS (Pučko/Čater 2008; Král et al. 2007; Wagner et al. 2007; Alas/Zernand 2002; Slávik 2001). *Second*, recent studies report some positive effects of strategically aligned PMS on organizational entrepreneurship, innovativeness (Bratnicki et al. 2009) and performance (Čadež/Guilding 2008). However, poor cascading and a lack of alignment to incentive systems appear to be the most critical factors preventing companies from increasing their financial performance in companies with relatively consistent alignment of performance indicators with the corporate and business strategy (Rejc Buhovac/Slapničar 2007).

Cascading

Empirical research involving PMS cascading in CEE countries is rather rare. Four studies were found which investigate this critical issue (see Table 3).

An early study (Bodnár/Dobák 1998) surveyed Hungarian companies with regard to *the practice of Balanced Scorecard implementation*. Researchers found that the elaboration of the BSC was typically limited to a single organizational unit. A survey by Pučko and Čater (2008) investigated *normative attitudes of managers toward cascading*. Managers of companies with the BSC suggested that the BSC could not be efficient unless it was applied in each business unit as well as at the corporate level.

A two-stage multiple case study (research findings were published in two consecutive papers, i.e. Epstein et al. 2004; Rejc Buhovac/Slapničar 2007) investigated *the impact of PMS cascading on financial performance*. In both studies, cascading was found as one of the two critical elements (alignment with incentive system being the second) in enhancing a firm's performance. More specifically, qualitative studies revealed that multidimensional and balanced performance measurement with poor cascading and a lack of alignment to compensation did not increase financial performance.

Alignment with incentive systems

A review of research of PMS alignment with incentive systems highlights several interesting findings. Two studies investigated the general *alignment between PMS and incentive systems*. Bodnár et al. (2009) found that poorly elaborated soft management systems (such as implicit motivation through top management commitment, open communication, supportive organizational atmosphere etc.) led to unsuccessful implementation and use of the BSC. Wagner et al. (2007) similarly reported that PMS were not supported by explicit motivation systems throughout the organizations. Rather, performance-based compensation was more frequent for executives than for non-executives.

Table 3: Cascading Studies

Study	Method	Companies/ Subjects	Domain	Results
Pučko/Čater (2008)	Survey/ Descriptive Analysis	172 Slovenian companies	The impact of PMS on effective strategy implementation	Managers of companies with the BSC suggest that the BSC cannot be efficient unless it is applied in each business unit as well as at the corporate level.
Rejc Buhovac/ Slapničar (2007)	Case Study Interviews & Survey/ Descriptive Analysis, Graphical Analysis	8 Slovenian companies (119 survey participants and 48 interviewees)	The impact of PMS cascading on financial performance	In companies with comprehensive and balanced performance measurement, poor cascading and a lack of alignment with incentive systems appear to be the most critical factors preventing the companies from increasing their financial performance – despite the relatively consistent alignment of performance indicators with the corporate and business strategy.
Epstein et al. (2004)	Case Study Interviews, Survey/ Descriptive Analysis	103 managers (6 Slovenian companies) – survey, 36 managers – interviews	The impact of PMS cascading on financial performance	Multidimensional and balanced performance measurement with poor cascading and a lack of alignment to compensation does not improve financial performance. On the contrary, focused performance measurement which is well cascaded throughout the organization and supported by a tight control mechanism may improve financial performance.
Bodnár/ Dobák (1998)	Survey/ Descriptive Analysis	61 Hungarian companies	Balanced Scorecard implementation	In a significant number of cases, the elaboration of the BSC was limited to a single organizational unit.

Pučko and Čater (2008) investigated the *managers' normative attitudes toward the alignment of PMS and incentive systems*. Researchers expectedly found that managers of companies with the BSC suggested that the BSC could not be efficient unless it was supported by an appropriate reward system.

Regarding *the impact of compensation schemes on the design and use of PMS*, Rejc and Slapničar (2003) found no support for the hypothesis that the inclusion of traditional performance measures in managing directors' compensation contracts stimulates consideration of the same type of performance measures in internal performance measurement systems. A specific investigation of *PMS and incentive systems in foreign subsidiaries* by Hočevar et al. (2001) reported that the majority of companies used the same profit to evaluate the performance of both, subsidiaries and their management. Performance evaluation system which does not distinguish between controllable and uncontrollable factors, results in sub-optimal decisions related to investment and management motivation.

As already noted, two multiple case studies (Epstein et al. 2004; Rejc Buhovac/Slapničar 2007) investigated *the impact of PMS alignment with incentive systems on financial performance*. The first qualitative study found that companies with comprehensive and balanced PMS, but with a lack of alignment of these PMS to compensation, failed to improve their financial performance. The other qualitative study complemented these conclusions with the finding that in complex and dynamic business environments effective organizations may combine tight controls with more open, informal and flexible information and communication systems to stimulate and channel employee behaviour toward the achievement of overall organizational goals, rather than implement formal incentive systems aligned with PMS.

The findings drawn from the existing contributions of the research focusing on the PMS alignment with incentive systems (Table 4) support the notion that incentive systems in CEE companies are not well aligned with performance measurement systems (Bodnár et al. 2009; Wagner et al. 2007; Hočevar et al. 2001; Epstein et al. 2004), although managers recognize that PMS cannot be efficient unless they are supported by an aligned incentive system (Pučko/Čater 2008).

Table 4: Alignment with the Incentive System Studies

Study	Method	Companies/ Subjects	Domain	Results
Bodnár et al. (2009)	Case Study Interviews, Archival/ Descriptive Analysis	1 Hungarian company	Balanced Scorecard implementation through soft systems	Poorly elaborated soft management systems (implicit motivation through top management commitment and support, open communication, supportive organizational atmosphere etc.) led to unsuccessful implementation and use of the BSC.
Pučko/ Čater (2008)	Survey/ Descriptive Analysis	172 Slovenian companies	The impact of PMS on effective strategy implementation	Managers of companies with the BSC suggest that the BSC cannot be efficient unless it is supported by an appropriate reward system.
Rejc Buhovac/ Slapničar (2007)	Case Study Interviews & Survey/ Descriptive Analysis, Graphical Analysis	8 Slovenian companies (119 survey participants and 48 interviewees)	The impact of aligned PMS and incentive systems on financial performance	The qualitative study finds that in complex and dynamic business environments, effective organizations may combine tight controls with more open, informal and flexible information and communication systems to stimulate and channel employee behaviour toward the achievement of overall organizational goals, rather than use formal incentive systems aligned with PMS.
Wagner et al. (2007)	Survey/ Descriptive Statistics, Pearson's Correlation Coefficient	44 large non-financial Czech companies	Strategic PMS and incentive systems	Performance-based compensation is more frequently applied for executives rather than non-executives.
Epstein et al. (2004)	Case Study Interviews, Survey/ Descriptive Analysis	103 managers (6 Slovenian companies) – survey, 36 managers – interviews	The impact of alignment between PMS and incentive system on financial performance	Companies with comprehensive and balanced PMS, but with a lack of alignment of these PMS to compensation, fail to improve their financial performance.

Rejc/ Slapničar (2003)	Survey/ Spearman's Rank Correlation, Factor Analysis	105 large Slovenian companies	The impact of compensation schemes on the design and use of PMS	No support for the hypothesis that the inclusion of traditional performance measures in managing directors' compensation contracts stimulates consideration of the same type of performance measures in internal performance measurement systems. Managing directors of Slovenian companies pay a lot of attention to the non-financial indicators of success
Hočevár et al. (2001)	Survey/ Independent Samples T-Test, Regression Analysis	119 Slovenian companies	PMS and incentive systems in foreign subsidiaries	Majority of companies use the same profit to evaluate the performance of both subsidiaries and their management. In addition, they do not take effects of transfer prices into consideration in the performance evaluation process. Performance evaluation system which fails to distinguish between controllable and uncontrollable factors results in sub-optimal decisions related to investment decisions and management motivation.

Future research directions

The preceding review indicates that each of the four determinants of PMS design has been examined to some degree, but significant opportunities exist in each area. First, we highlight specific research opportunities within each of the four determinants of contemporary PMS. Then, we propose some additional research questions along with some thoughts on research methods.

Future research on multidimensionality

First, it is important to enhance the richness of multidimensionality variables. For example, many existing surveys in CEE countries focus on the Balanced Scorecard as a surrogate for multidimensionality. Additional research should use other, state-of-the-art and more comprehensive research tools to investigate PMS used by CEE companies. Various other perspectives may constitute PMS multidimensionality (see, for example, Brignal (2002) critique of the Balanced Scorecard), specifically in other cultural contexts such as CEE, characterized also by different historical and legislative characteristics (for example, see Bollinger 1994; Fogel 1994; Child/Czeglédy 1996; Soulsby/Clark 1996; Malý 2002; Dunkel/Meierewert 2004; Warner et al. 2005).

Second, a thorough analysis is needed on contemporary PMS and their impact on financial performance that reaches beyond that proposed by the North American and the West European theory and practice. Performance measurement in the CEE lacks the critical mass of related studies needed to reconcile conflicting results and reach consensus on the performance benefits of various performance measurement practices.

Third, causality of contemporary PMS multidimensional perspectives should be investigated. Most of contemporary performance measurement frameworks implicitly suggest that there are cause-and-effect relationships between the drivers of various aspects of performance. The Balanced Scorecard, for example, is built around the causal linkages between the drivers of learning and growth, internal processes, customers, and financial perspectives. Specific investigation of temporal relationships between actual actions and performance is needed to see whether these Western frameworks are equally successful in business contexts with different cultural backgrounds.

Future research on PMS strategic alignment

Further research is needed to better understand why PMS in CEE countries are not as closely aligned with company strategies as theory suggests. More specifically, additional research should engage in assessing management accounting and management control expertise in evaluating the types of knowledge and abilities needed by managers. For example, research could address whether a manager's overall experience and tenure affect the strategic

focus of PMS. Experimental research involving manager expertise could be used to supplement the extant survey literature.

Second, we encourage research on the nature of traditions and values fostered by the CEE managers and how these impact their decision-making and use of strategic information. Several studies highlight specific strategic orientations of CEE managers, such as maintaining employment and strategy of survival (Malý 2002), short-term orientation (Horváth et al. 2008), strong relationships with the local communities (Warner et al. 2005) etc.

Third, we highlight the need for research on other factors that are associated with the quality of information provided to managers, such as professional knowledge of accountants, the quality of management information systems etc.

Finally, it is of particular interest to reveal whether the ability to attract young, knowledgeable, and flexible managers (capable of introducing and using contemporary PMS) varies with company characteristics such as size, industry, and proxies for agency costs.

Future research on PMS cascading

The relative paucity of research on PMS cascading in CEE countries is probably due in large part to the methodological challenges associated with measuring and assessing the construct. Cascading is difficult to observe directly, because one needs to disentangle the aggregate information at the upper hierarchical levels to individual drivers of this information at lower hierarchical levels. Further, understanding the cause-and-effect relationships between the various drivers of success among different hierarchical levels in the organization is needed to set up (or investigate) a proper cascaded system of information. In addition, examination of cascading requires comprehensive studies of multi-business companies with units of investigation coming from all hierarchical levels. Despite these methodological and resource-related issues, we highlight the need to assess the role of PMS cascading in enhancing the effectiveness of contemporary PMS.

The study by Bodnár and Dobák (1998) found that the application of a contemporary PMS was limited to a single organizational unit. Further research is needed to investigate what organizational and other obstacles (such as the lack of top management commitment, conflicting interests of managers at different hierarchical levels, management information systems etc.) inhibit the proliferation of contemporary PMS throughout the organization.

Future research on PMS alignment with incentive systems

First, we highlight the need for research on factors that are associated with the development of incentive systems in CEE countries. Several authors describe the prevailing *egalitarianism* among workers (and managers), worker self-management, and the power of workers and labour unions in centrally planned

economies (Stanojević 2001; 2004; Otte 2003; Rejc 2004; Warner et al. 2005). We suggest the need to investigate whether these factors still play such a strong role in determining performance criteria and whether they inhibit the development of contemporary incentive systems.

Second, we suggest innovative research methods to further investigate this challenging area. For example, analytical modelling could be useful in developing a CEE-country-specific theory related to manager incentives under different reward (compensation) and penalty (legal liability) schemes. More specifically, research is needed to investigate which performance indicators are applied in management compensation contracts in the CEE countries, whether they are aligned with PMS, what is the proportion of the CEO's variable compensation, and how this alignment is instrumental in enhancing company performance. Alternatively, experimental markets lend themselves to the use of alternative subject groups (such as CEE students) in tightly controlled laboratory settings. Such experiments could be used to provide useful insights into the role of various performance variables (for example, financial vs. non-financial performance measures of success) as criteria for financial incentives.

Overall discussion on future research

From an overall perspective, future research should also be directed at the following: *firstly*, understanding of the role of contemporary PMS in enhancing firm profitability could be improved considerably by investigating the interaction among the four determinants of contemporary PMS. Research questions addressed in these studies should include questions regarding how multidimensionality variables interact with strategic focus variables and how they align with incentive systems variables. In addition, further research is needed to confirm the impact of multidimensionality, strategic focus, cascading, and the alignment between PMS and incentive systems on PMS effectiveness. Very few studies in CEE have addressed this question (Epstein et al. 2004; Rejc Buhovac/Slapničar 2007), and even these have been qualitative, case study-based. Additional (quantitative) research is needed to explore the interrelatedness of these issues.

Secondly, a large number of authors (Čadež 2002; Szychta 2002; Haldma/Lääts 2002; Päril 2006; Wagner et al. 2007; Zoltay Paprika et al. 2008) reported the lack of appropriate management accounting knowledge as a factor holding back the development and use of contemporary performance measurement systems. Other studies report on the lack of general management skills and knowledge (Vámosi 2000; Slávik 2001) that goes back to the management formation and development practices germane to the CEE area (see also other studies, e. g. Child/Czeglédy 1996; Djankov/Pohl 1998; Pučko 1998; Edwards/Lawrence 2000; Robinson/Tomczak-Stepien 2000; Illes/Rees 2001; King et al. 2001; Kozarzewski 2001; Warner et al. 2005). Specific issues of interest include (a)

whether management accounting and management control knowledge and skills differ across countries and cultures; (b) how have these knowledge and skills changed in the last ten years; and (c) whether improvements in this area influence the performance measurement systems at their companies.

Thirdly, empirical research still fails to build on prior studies to increase the understanding of the topic. Only a couple of studies use the longitudinal approach or build on prior research (Epstein et al. 2004; Rejc Buhovac/Slapničar 2007; Bodnár et al. 2007; Zoltay Paprika et al. 2008).

Fourthly, we also underline the need to assess the generalizability of research findings. For example, future research is needed to study whether country-specific findings are applicable to the CEE region as a whole. Most of the studies included in this paper focus on a single CEE country (the only exception being the study of the Czech Republic, Estonia, and Hungary by Horváth et al. 2008). A cross-country or worldwide comparative research project is needed to assist in: 1) providing a comprehensive review of prevailing contemporary performance measurement practices; 2) offering statistically supported arguments of the impact of PMS on financial performance; 3) pointing out country-specific factors of contemporary performance measurement systems in the CEE region; and 4) providing relevant information needed for comparison of PMS practices in the CEE region with those in the North America and Western Europe.

In addition, along with the suggestion to improve the scientific rigor of existing research, alternative research methods should be considered to triangulate the literature and provide new theoretical and practical insights to enhance the role of contemporary PMS. Our review indicates the relative dominance of survey methods. Analytical modelling and (psychology-based) experiments could be used to gain useful insights into the role of various PMS determinants in enhancing the profitability of firms.

Finally, additional research is needed to investigate the differences between companies that are still owned by governments and influenced by political interests, companies that belong to multinational corporations (where the parent company likely determines the development and implementation of PMS), and companies owned by domestic investors. Such research could expand the current understanding of how ownership determines the use of contemporary tools (Cox et al. 1998; Gregorič et al. 2000; Pučko 2005; Warner et al. 2005).

Implications for managers

It is important to denote that the literature review presented in this paper should be considered a review of academic literature rather than a review of prevailing management practices in CEE countries. In spite of this, the study offers several managerial implications for both, the companies which are not from one of the

CEE countries and which are considering a launch of activities in CEE countries, as well as the companies or managers of CEE-origin.

First, although evidence has been provided that performance measurement practices in CEE countries lag behind their Western counterparts, there is also apparent evidence of a transition from a predominant reliance on financial measures toward the use of balanced PMS. Integrated, multidimensional PMS have been found particularly useful in larger organizational settings where management control is a complex challenge. For SMEs, the development of contemporary PMS is rare and expectedly conditioned by available resources (and managerial knowledge). In both cases, the deployment of contemporary multidimensional PMS depends heavily on the accounting and management control knowledge of managers and other decision-makers. It is of highest importance for both foreign companies operating in CEE countries (or considering the launch of operations in this region) as well as for domestic ones, that the knowledge-related problem is properly addressed and that management training and education in the field of contemporary management control are provided.

Second, CEE studies confirmed that multidimensional and balanced performance measurement will not lead to increased financial performance if not cascaded and aligned to compensation systems. However, there is another obstacle to effective implementation of PMS systems germane to the CEE region. The average variable part of a CEO's compensation typically amounts to only 15% of the total (see, for example, Otte 2003; Rejc/Slapničar 2003). When the potential size of exercises under compensation plan arrangements is small relative to that of basic salaries, and benefits in particular, then the achievement of compensation scheme targets is unlikely to act as a powerful influence on executive priorities. As a consequence, the relatively small performance-dependent part of CEO compensation schemes may act as an additional barrier to a positive impact of aligned performance measurement and incentive systems on financial performance. With this in mind, companies operating (or planning to operate) in CEE countries need to consider redesigning management compensation contracts.

Finally, it is important to emphasize that replication of Western practices is not considered the best solution to the evolution of contemporary PMS in CEE. As Child and Czeglédy (1996) put it, "a specific set of culturally-generated efficiency values in economic decision making" is one of the characteristics of a model of market perfection. It is by no means clear that this system is best suited to countries which do not share the individualistic cultural paradigm of the Anglo-Saxon countries. Individual CEE countries need to build on existing performance criteria in order to create performance measurement practices in tune with their social and cultural environment as not all practices admired abroad are necessarily appropriate, nor do they fit culturally with local practices.

Individual national cultures may be in fact better aligned with different models of management formation and, consequently, performance measurement.

Conclusions

The paper investigates the current status of performance measurement systems research in Central and Eastern Europe. It exposes the most important empirical findings from the previous research in a single study and underlines those areas of research that have been neglected or under-examined. It specifically suggests what future research needs to be done from the perspective of PMS multidimensionality, strategic alignment, cascading, and alignment of PMS with incentive systems, as well as from an overall perspective.

The literature review indicates that each of the four determinants of PMS design has been examined to some degree, but also that significant opportunities exist in each area to gain a better understanding of PMS effectiveness. Extant literature typically focuses on either one country or, and this is rather rare, presents empirical comparisons based on a few selected countries. In addition, the focus of most existing studies is on selected performance measurement issues. This paper upgrades the existing literature by offering a comprehensive overview of all empirical research on contemporary PMS in CEE countries in a single study and by providing a synthesis of research findings useful for foreign and CEE managers.

The paper has limitations, too. For example, although a number of researchers have studied the characteristics of performance measurement systems in the CEE, our analysis reveals that only a few contributions of high quality have so far been published in major academic journals. While focusing on well-established research conferences from the field, a number of studies included in our review are still either based solely on case studies, or their analyses are limited to descriptive statistics which may compromise the reliability and validity of empirical findings.

Another limitation of the study is related to the absence of information on the ownership structure of sample companies in the empirical papers. In most cases, local subsidiaries of multinational organizations based in North America or Western Europe were not considered as a separate sample or cluster of companies.

Our study is focused on contributions in English language only. Studying papers published in national academic journals or presented at research conferences in local languages might add to a more profound understanding of contemporary performance measurement systems in CEE. Such approach would require an international team of researchers.

Due to these issues, a significant gap might exist between research findings and actual practice in the field of contemporary performance measurement systems.

In this context, the literature review presented in this paper should be considered as a review of academic literature rather than a review of prevailing management practices in CEE countries.
